ABSTRACT OF THE DISCLOSURE

A function reconfigurable semiconductor device is provided. The function reconfigurable semiconductor device includes a plurality of function cells, each of the function cells being a basic unit which realizes a function; each of the function cells including a plurality of threshold elements; each of the threshold elements including means which stores a threshold value; and wherein a function which is realized by the function cell is 10 determined by determining the threshold value in each of the threshold elements. In addition, the semiconductor device includes a nonvolatile memory which stores data for realizing the function in the 15 function cells.
